Progress Report Number 1

Full Name : Steven Anderson
Student ID : 300414292

F26_3375_S3_G3_Impulse_Play

Date	Number of Hours	Description of work done
Sept 28, 2025	20~ Minutes	1. Asking ChatGPT for project suggestions.
Sept 29, 2025	30~ Minutes	1. Hearing Hung's ideas and setting up a meeting with you.
Oct 1, 2025	2 Hours 30~ Minutes	1. Meeting with you. 2. Asking ChatGPT to expand my and Hung's ideas.
Oct 6, 2025	1 Hour 30~ Minutes	1. Explaining my expanded idea. 2. Deciding one idea for the proposal. 3. Get into details and what we want to change with the current idea. 4. Joining GitHub repo.
Oct 8, 2025	2 Hours 15~ Minutes	1. Generate the project proposal document. 2. Checking the generated document. 3. Revise some parts. 4. Upload to google docs for Hung to access and edit.
Oct 9, 2025	2 Hours 30~ Minutes	1. Brainstorm with ChatGPT for a good project name and logo for proposal document. 2. Completing project proposal for submission.
Oct 13, 2025	5 Minutes	1. Register and join the Figma project.
Oct 16, 2025	20~ Minutes	1. Reconfirming with Hung if he invited the professor as collaborator for GitHub.
Oct 17, 2025	2 Hours 30~ Minutes	1. Filling GitHub to match the requirement for the project. (Readme, folder, etc.) 2. Communicate with Hung to rename the project to match the updated one, reminding him to add you as

		collaborator, also reminding him to upload his own progress report to GitHub. 3. Watch User Requirement Gathering on BlackBoard.
Oct 18, 2025	4~ Hours	1. Organize this progress report. 2. Learning Figma. 3. Configure student plan. 4. Let Hung know to register as a student.

Sept 28th - First time asking ChatGPT for ideas it has. None of the ideas are interesting.

Sept 29th - Having a small meeting on Discord talking about his ideas. Also setting up a meeting with you.

Oct 1st - Having Teams meeting with you. Coming with an idea from my own problem; where I like playing badminton but I don't really know many communities. The community that I know plays on a fixed schedule every week and the timing usually collides with my work/ class schedule. Expanding all the ideas with ChatGPT.

Oct 6th - Presenting Hung with all expanded ideas. Choosing the one we feel good about. Changing the expanded idea with what we think the app should look like. Joining GitHub Repo.

Oct 8th - Generating the first project proposal document based on what has been discussed previously. Verifying all required sections and revising. Uploading to google docs so we can work together to finish the proposal.

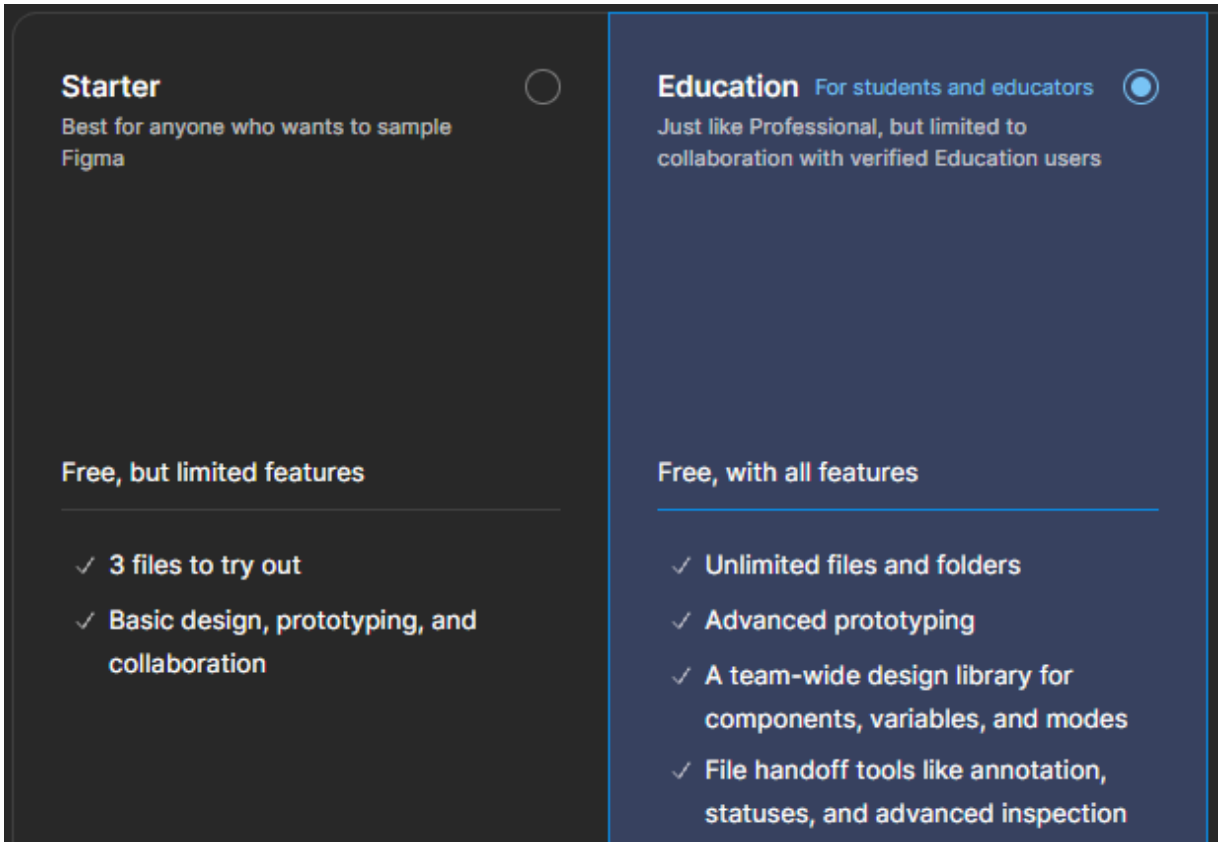

Oct 9th - The previous name we chose has been used for sports apps, so I brainstormed another name for the project with ChatGPT. After getting another name I ask ChatGPT to generate a logo for the project proposal.

Oct 13th - Register and join the Figma project.

Oct 16th - I asked Hung whether he added you yet as collaborator in GitHub since he's the owner of the repository. I've emailed you the link for GitHub just to prove it's been created.

Oct 17th - First time working on the progress report. Emailing you some questions regarding the reports. Reminding Hung to update the project name and inviting you as collaborator. Properly filling GitHub (including readme) to follow project requirements. I intended to jump into Figma but based on the project slide I better watch user requirements gathering.

Oct 18th - Fixing progress report to sync with project proposal and with feedback you gave. Familiarize myself with the Figma environment. Start learning Figma from the link mentioned in the project slide. Re-register using student email to get the benefit of their education plan.

AI Use Section:

Tool name, version, and account type	Specific use
OpenAI Codex (GPT-5.6); account type: plus	1. Letting the AI get into details from my initial idea. 2. Create a logo for the project proposal document. 3. Changing details provided by AI to better suit the novelty of the program and my taste. 4. Help suggesting project names. 5. Creating project proposal documents.

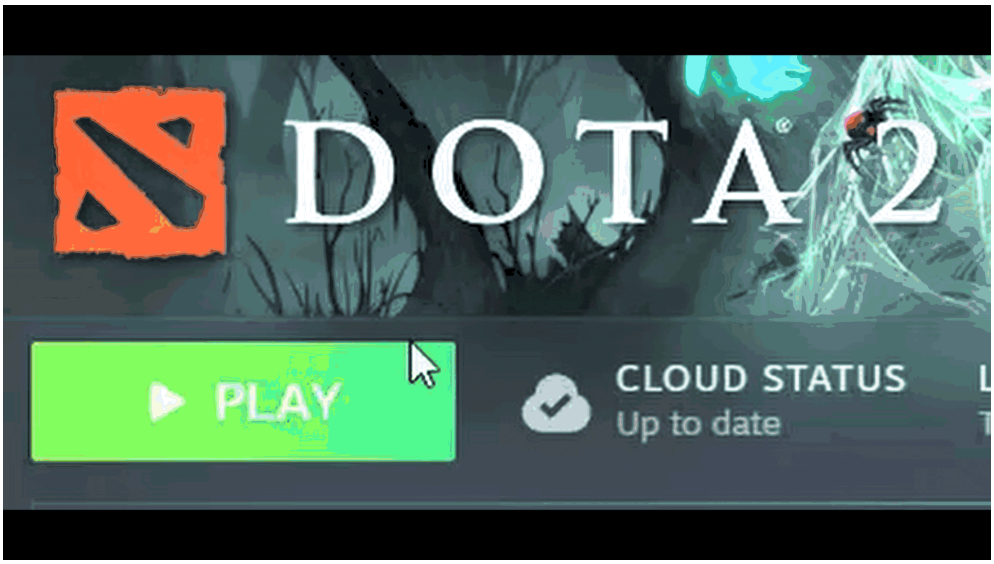

Value Addition (Sync with table above):

1. After the idea expanded I'm changing some parts to make the apps unique. I think I re-engineered the whole app to suit my taste and make it novel. This is the initial generated idea:

> The prototype will demonstrate:
>
> - choosing an initial sport and a Find, Form, or Fill path;
> - entering the matching criteria described in the concept;
> - seeing an automatically proposed group and game;
> - reviewing player compatibility, a suitable facility, team balance, cost estimate, and game status;
> - providing the four lightweight types of post-game feedback; and
> - moving a compatible player into the user's Sports Circle.

Since I like playing DotA2, I try to integrate many ideas from there. I'm providing some gifs to help you get some idea how the game works generally, the way I actually integrate it is in the appendix.

a. Clicking play is just like how you open the apps.

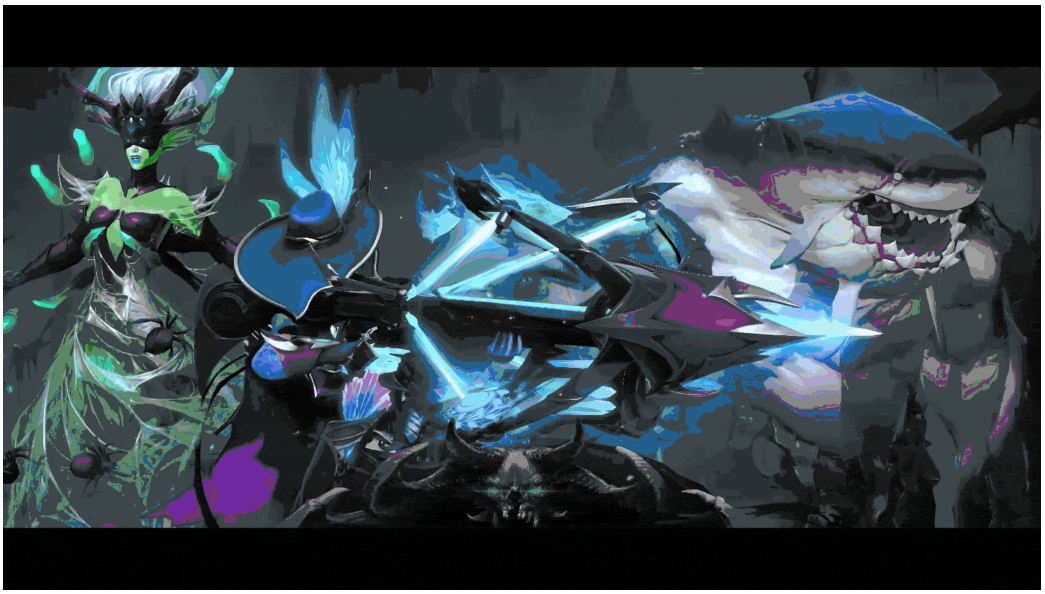

b. The game will automatically find the nearest server (US West) and default match type (Normal Match/ Turbo). The apps mimic this behavior, in which the system will try to match the user to have a match nearby their location (but they can

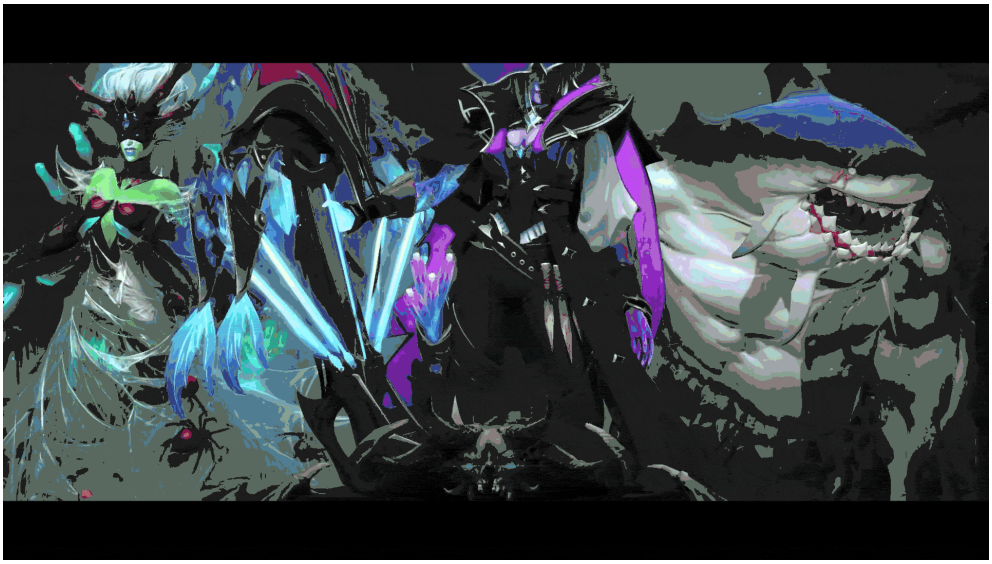

also pick if so desired).

c. After a match is found and everyone accepts the match, the system will create a server for them to play together.

- If 1 or more users decline, the system will resume finding another match. While the users who declined got a 5 minutes waiting time penalty before they can find another match.

d. Post match, every user can do many things. They can commend another user, dodging to match with specific user(s), and report user(s). Another stuff they can do is seeing many types of information, common one is kill, death, assist.

2. The initial logo generated has an “insurance” type of color palette. So initially I make the AI change the logo itself but after that I’m using the initial logo with a sporty color palette change.

Initial logo	Changed logo	Final logo

3. I think I have stated it on number 1.
4. Basically brainstorming with ChatGPT.
5. Most of the time I use the web version of ChatGPT. I'm using Codex CLI to generate the initial project document and modify it.

Appendix

Mon, Sept 28 5:26 AM

> I have a project for ui/ux design, the goals is more into the novelty side but still have to be usable and practical. can you help giving me ideas for the project?

Thu, Oct 1 8:29 AM

> was there any app for sports interest in canada? so for someone who doesn't have any friend or maybe have friends but need more people to gather more people

> my groupmate have another idea, it's tinder but for food or something like that. I was thinking to have users to swipe right to add the food into some sort of bookmarks with recipe, he's thinking to share the restaurant location when user swipe right

Thu, Oct 8 11:46 PM (Codex)

> help me make a project proposal words with the requirement from project requirement.txt,
>
> all my ideas is in ImpulsePlay Idea.txt. Don't invent something that is not in the ideas, let me
>
> know if you have any question. Leave the project contract section blank, I will edit that part.

Put the title page as placeholder also, just put the app name.The project only going to be made in Figma as prototype

why you put 3 paths for user to choose rather than just finding match like how online pvp game works like dota?

so if people have friends to play but missing more people they can just create a party then find a match together. they will automatically find a match nearby their location/ city but they can change or add more city to find. like how dota player can change their region for matching. then after they found enough people, the system will propose the date and location for the play and the players will decide whether to accept or decline. declining too much will punish them. if for example everyone accept but one decline, they will be pooled in the same "temporary party" to find the missing player. after they put into the date and location that have been chosen, the system will keep finding more people to participate until a reasonable amount of participant is reached for substitution, since people who lean into casual play tend to substitute player when they're tired to maximize the usage of the field. we can also make an option to not find more people if minimum player reached. Then after all of that, the system will split the bill for every participant. Like how online order works, it will ask each participant how to pay the bills. After all participant paid successfully, the system will pay it automatically and give the details information to the players regarding the match, also if its something like badminton where you need racket and shuttle cock the details will tell the user to bring the equipment themself or if the place provide borrowing service for the equipment. That's what I'm thinking.

Decline consequence: both a temporary cooldown and a reliability score, with email reverification after excessive declines. Search-area control: the party leader chooses the city or cities. Payment failure: replace the unpaid player. Additional idea: a leader can invite someone without the app through a temporary profile, with accountability for bringing unreliable guests.

Temporary guest participation: browser invitation link. Guest identity: verified phone or email. Extra-player target: sport-based suggestion, but the party must choose the option before matchmaking and cannot stop it after matchmaking begins.

Temporary guest participation: browser invitation link. Guest identity: verified phone or email. Extra-player target: sport-based suggestion, but the party must choose the option before matchmaking and cannot stop it after matchmaking begins.

Temporary guests are confirmed by the party leader and are assumed to have the same availability as the leader; registered members confirm themselves. Only objective guest failures affect the leader. If a guest fails to pay, the leader must cover the remaining share before a deadline.

Implement the plan.

Fri, Oct 9 12:34 PM

we decided to use the sport matching idea. can you suggest me names that haven't been used

how about play starter? does it been used?

how about play spark?

how about ImpulseGaming

does impulse play been used?

can you generate image for the logo of the proposal

can you make another one, this logo reminds me something like insurance

I like the previous one better, maybe try to change the color scheme
